1. Let  $ABC$  be an acute-angled triangle with  $AB$  not equal to  $AC$ . The circle with diameter  $BC$  intersects the sides  $AB$  and  $AC$  at  $M$  and  $N$  respectively. Denote by  $O$  the midpoint of the side  $BC$ . The bisectors of the angles  $\angle BAC$  and  $\angle MON$  intersect at  $R$ . Prove that the circumcircles of the triangles  $BMR$  and  $CNR$  have a common point lying on the side  $BC$ .
2. Find all polynomials  $f$  with real coefficients such that for all real numbers  $a, b, c$  with  $a + b + c = 0$  we have  $f(a - b) + f(b - c) + f(c - a) = 2f(a + b + c)$ .
3. Define a “hook” to be a figure made up of six unit squares as shown in the picture below, or any of the figures obtained by applying rotations and reflections to this figure.

Determine all  $m$  by  $n$  rectangles that can be covered without gaps and without overlaps with hooks such that

The rectangle is covered without gaps and without overlaps. No part of a hook covers area outside the rectangle.

4. Let  $n$  be an integer greater than or equal to 3. Let  $t_1, t_2, t_3, t_4, t_5$  be positive real numbers such that

$$n^2 + 1 \text{ is greater than } (\sum_{i=1}^n t_i) \left( \sum_{i=1}^n \frac{1}{t_i} \right).$$

Show that  $t_i, t_j, t_k$  are side lengths of a triangle for all indices  $i, j, k$  satisfying  $i$  less than  $j$  and  $j$  less than  $k$ , and each index at most  $n$ .

5. In a convex quadrilateral  $ABCD$  the diagonal  $BD$  does not bisect the angles  $ABC$  and  $CDA$ . The point  $P$  inside  $ABCD$  satisfies  $\angle PBC = \angle DBA$  and  $\angle PDC = \angle BDA$ .

Prove that  $ABCD$  is a cyclic quadrilateral if and only if  $AP = CP$ .

6. We call a positive integer alternating if every two consecutive digits in its decimal representation are of different parity. Find all positive integers  $n$  such that  $n$  has a multiple which is alternating.
